

My data, business intelligence, product management, and SaaS development journey is one born of my life-long commitment to learning and evolving. After 6 years building and evaluating online learning programs on the Professional Services: Learning Design & Strategy team at the B2B LMS+ SaaS BenchPrep, I transitioned my ongoing analytics, business intelligence, and data governance work to the company's Data Products team at its earliest stages of the data maturity lifecycle and platform development.

My substantial prior exposure with its legacy data artifacts and my ability to rapidly learn new concepts, architecture, and tools allowed the team to hit the ground running in analytics development, migration, and enhancement. As a result, I contributed to the company's ever-improving platform growth strategies and tactics as we migrated, developed, and iterated on a huge variety of reporting products, all from the ground up.

Our three-person team developed embedded, white-labeled analytics with row-level security to support multi-tenancy use cases. I also worked on many ad hoc business intelligence projects to deliver critical insights to customers and coworkers for marketing, product management & strategy, and business development purposes: satisfying grant-based funding renewals, prioritizing new feature development and bug fixes, and identifying content or instructional gaps in customers' existing learning products to recommend future enhancements are a few examples of business intelligence value-adds. Through these experiences, I learned a lot about the impact data tool/vendor selection can have on the long-term success of an organization's business intelligence goals. I also identified and implemented cross-functional collaboration strategies to capture critical institutional knowledge and share it efficiently across the organization.

I have ample hands-on experience transforming data, constructing models, and building dashboards and reports with Domo, Sisense, Snowflake, Pendo, and Google Analytics, including query customization and in-app ETL. In one extensive initiative, I investigated, developed, and enhanced complex usage and billing queries and reports for dozens of enterprise customers, streamlining customer success and finance operations, increasing the accuracy of the organization's invoices, and enhancing the customer analytics experience. In addition to these on-the-job data analysis experiences, personal projects gave me exposure to additional business intelligence tools like Power BI, Tableau, and Looker. Along the way, I developed, championed, and owned several data governance processes to efficiently enable stakeholders on our data products, including data dictionaries, diagrams, tutorials, and product presentations.

The intersection of the non-technical and the technical functions is the most fascinating place in a business to me. A business's own data is one of their greatest resources, and analyzing it - how customers and users engage with their products and services every day, what value are they getting out of them - to translate that metadata into actionable insights for smarter business decisions and sustainable growth moving forward - is something I find intrinsically motivating.

I also love breaking down institutional knowledge silos through cross-functional collaboration, efficient system documentation that's often an unsung byproduct of business analysis work, and evangelizing how tapping into the data so many businesses already sit atop can drive business success. Transparent communication at every level of an organization empowers everyone to share what they know, learn from each other, and be even better tomorrow.

In all my professional roles, I consulted on and shaped organization's multi-channel product strategy and management through Agile and Scrum methodologies, especially: gathering and refining business requirements through stakeholder interviews, market research, and real-time product analytics, and writing high-quality user stories for both agile and waterfall feature development. I've also acquired substantial direct vendor selection, negotiation, and management experience working with global digital services and SaaS vendors.

With my 9 years of experience building and analyzing business processes and product data and delivering business insights at a B2B SaaS EdTech company, I would add great value to your analytics initiatives.

Thank you,

Jordan Williams
